

# Understanding the Early Development of Cerebral Palsy

## Research Study

### What's this study about?

We want to understand how different aspects of development such as movement and communication develop in babies who have cerebral palsy (CP) or are at high risk of CP.

### What is involved?

- Participation in this study involves assessments with your child every 3 to 6 months until your child turns 2. Sessions will take no longer than 2 hours.
- Your participation will help to achieve significant advances in understanding the early development of CP.

### Do you:

- Have a baby who is under 12 months of age corrected for prematurity who has a diagnosis of CP or at risk of CP?
- Live in Sydney, Brisbane or Melbourne?
